SUMMARY

Palantir Foundry Data Engineer and Application Developer with experience building enterprise data pipelines, ontology-driven applications, Python functions, and document processing solutions. Skilled in developing end-to-end data workflows, interactive applications, custom data retrieval solutions, and business-focused automation. Currently contributing to US healthcare and pharmaceutical analytics solutions using Palantir Foundry.

TECHNICAL SKILLS

Data Engineering: Palantir Foundry Code Repositories, Pipeline Builder, Contour, Data Connection, REST APIs, Data Lineage, Build Schedules, Data Validation, Data Transformation, Data Health Checks
Application Development: Workshop, Slate, Custom React Widgets, Ontology Manager, Object Types, Link Types, Actions, Function-Backed Actions, Object Set Filtering, Foundry Automate
AIP: AIP Agent Studio, AIP Logic, AIP Pipelines, Function-Backed Chat Applications, Multi-Agent Workflows, Prompt Engineering, Retrieval-Augmented Generation, External Tool Integration, Document Retrieval, Root Cause Analysis
Visualization: Vega Charts, Vertex Graph, Contour Analysis, Interactive Dashboards, KPI Monitoring
Programming: Python, PySpark, SQL, Java, TypeScript, JavaScript, HTML, CSS, Python unittest, Foundry Ontology SDK, JSON Processing.
DevOps: Foundry Marketplace (Packaging, Versioning Installation across Environments), Git, Branching, CI/CD, Function Registry, Unit Testing, Function Diagnostics, Controlled Publication

EXPERIENCE

Palantir Foundry Data Engineer Application Developer **2024 – Present**
Tata Consultancy Services (TCS), Bangalore, India

- Built and maintained Foundry data pipelines and Ontology-driven applications for US healthcare analytics; implemented validation and quality controls associated with a 30% reduction in production rollbacks.
- Developed Workshop and Slate applications, custom widgets, KPI dashboards, and reusable Python workflows. Automated scheduled monitoring and alerts, reducing manual effort by 60%.

PROJECTS

Pharmaceutical Contract Claims Validation Platform *Foundry, Python, AIP Logic, Workshop, React, TypeScript*

- Developed the contract lifecycle workflow in Foundry, allowing business users to submit pharmaceutical contracts for review and approval. Implemented status-based workflows covering In Progress, Pending Approval, Approved, and Rejected, with superuser permissions to review and approve or reject submissions.
- Built the contract policy validation workflow, where users upload pharmacy and medical policy PDFs against approved contracts. Integrated AIP-based multi-agent evaluation with custom Python retrieval functions to identify relevant contract clauses and policy sections, compare requirements, and generate validation verdicts with supporting document evidence, reducing **over 400 hours** of manual validation effort per quarter.
- Integrated contract validation with claims processing to evaluate claims against approved pharmaceutical contract requirements and support claim approval or rejection. Helped identify contractual mismatches and prevent potential revenue and rebate leakage through automated validation.
- **Document Duplicate Detection:** Built a browser-based PDF/DOCX duplicate detection component using React, TypeScript, PDF.js, and fflate. Implemented SHA-256 file and normalized-text fingerprints alongside 128-slot MinHash signatures to detect exact and near-duplicate documents across Registry records and batch uploads, avoiding repeated AI evaluation and reducing associated processing costs by a reported 20%.

US Healthcare Payer PBM Analytics Platform *Foundry, PySpark, Workshop, Slate, Vega*

- Built a multi-source healthcare analytics application with KPI tables, historical trend dashboards, and interactive payer–PBM–contract relationship views. Implemented payer-brand subscriptions, threshold alerts, and contextual data retrieval, reducing root cause analysis and alert response time from hours to minutes while supporting 100+ weekly queries.

Foundry Research Data Stewardship Application *Foundry Workshop, Python, Ontology SDK, Tavily*

- Developed a Foundry Workshop application connecting ontology-backed source and candidate records, saved research evidence, and Python Functions to support automated candidate discovery and comparison. Integrated Tavily-backed live web search to provide current external information for research-assisted review.
- Automated case-to-candidate matching and selection, eliminating the need for data stewards to manually search, identify, and review candidate records for every case. Developed a consolidated read-only result view displaying case information alongside the selected candidate and validated the selection logic using unit tests.

CERTIFICATIONS

Palantir Certified Foundry Data Engineer – Professional
Palantir Certified Foundry Application Developer – Associate

EDUCATION

Bachelor of Computer Science and Engineering **2020 – 2024**
VSB College of Engineering Technical Campus – Anna University *9.0 CGPA*
